ANTX RELEASES 200-CHANNEL DIALOG ELITE

**Elite 200 operates as a dedicated hardware alarm
Platform for SCADA system**

AUSTIN, TEXAS... Antx, a leading provider of real-time monitoring, control and alarm notification systems for companies with remote assets that require maintenance, monitoring and control, has introduced the Elite 200, to provide a high-reliability dedicated hardware solution for alarms from SCADA systems. Users can configure the Elite 200 as either a Modbus RTU Master or Slave, allowing the SCADA to either push specific alarms to the Elite for alarm notification or be queried continuously.

The Elite 200 not only monitors data in the SCADA, but also monitors whether the SCADA is operating and if not, sends alarms to appropriate personnel. "By combining the power of the Elite 200's monitoring and notification capability with the ability to communicate directly with SCADA packages, users have gained some truly unique benefits." says Stephen Allen, CEO of Antx. "Not only do users get alarm messages with their customer message, but they can also call in to the Elite 200 to inquire about current values. The Elite 200 monitors analog and digital values in holding, input status and coil status registers. "

The Elite 200 is easily programmable from a PC without the need for any special Windows program. Users customize the Elite 200 for each application by entering unique voice and text strings for each point monitored. Installation consists of a serial cable to the SCADA, connection to a landline or cell-phone and mounting either in a panel or flush to a door.
